CAS INDEXING IS AVAILABLE FOR THIS PATENT.
AB This invention relates to a novel human deoxyribonuclease, referred to as human DNase II. The invention provides nucleic acid sequences encoding human DNase II, thereby enabling the production of human DNase II by recombinant DNA methods in quantities sufficient for clinical use.

The invention also relates to pharmaceutical compositions and diagnostic and therapeutic uses of human DNase II.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L5 ANSWER 3 OF 64 USPATFULL on STN

AB A human DNase polypeptide and DNA (RNA) encoding such polypeptide and a procedure for producing such polypeptide by recombinant technigues is disclosed. Also disclosed are methods for utilizing such polypeptide for preventing and/or treating bronchopulmonary conditions. Diagnostic assays for identifying mutations in nucleic acid sequence encoding a polypeptide of the present invention and for detecting altered levels of the polypeptide of the present invention are also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides the identification and characterization of two components of a recombinant preparation of DNase. These components are the purified deamidated and non-deamidated human DNases. Taught herein are the separation of these components and the use of the non-deamidated species as a pharmaceutical per se, and in particular in compositions wherein the species is disclosed within a plastic vial, for use in administering to patients suffering from pulmonary distress.

AB The present invention relates to the use of calcium ion and/or sugars to minimize thermal aggregation of DNase and to the use of calcium ion to stabilize liquid solutions of DNase, the solutions having a pH of less than neutral. DNase is the active pharmaceutical principle and the solutions may contain other pharmaceutically acceptable excipients making them suitable for pharmaceutical administration. In the first instance, calcium ion/sugar minimizes the effects of thermal aggregation in the solution. In the second aspect, calcium ion stabilizes the lower pH solutions from protein precipitation.

AN 2005-07193 BIOTECHDS
AB DERWENT ABSTRACT:

NOVELTY - Treating oncological, infectious or somatic diseases comprises acting on extracellular DNA, e.g. circulating in blood plasma.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for: (1) pharmaceutical agent for treating oncological, infectious or somatic diseases, comprising a substance (I) that has deoxyribonuclease activity and/or is capable of inactivating extracellular DNA; (2) monitoring the efficacy of the treatment of oncological, infectious or somatic diseases by monitoring the amount, molecular weight, fraction ratio, protein, lipid and sugar binding and/or nucleotide sequence of DNA freely circulating in blood plasma; (3) use of blood plasma DNA and extracellular microbial DNA to detect DNA involved in the onset and development of diseases, comprising cloning, sequencing and identifying genes, unique sequences and repeat sequences for subsequent study.

ACTIVITY - Cytostatic; Antibacterial; Fungicide; Protozoacide. Mice with transplanted Ehrlich tumors were treated twice a day on days 3-7 post transplantation by intraperitoneal injection with DNase I (1 mg/kg) in phosphate buffer (200 mul). Tumor volume on day 7 was reduced by 61 % compared with controls.

MECHANISM OF ACTION - Extracellular DNA inactivator.

USE - Treating oncological, infectious or somatic diseases, including malignant tumors, bacterial, fungal or protozoal infections, noninfectious somatic diseases and diseases caused by the accumulation of somatic mutations.

AB Matrix material was extracted from biofilms of Candida albicans and Candida tropicalis and analysed chemically. Both preparations contained carbohydrate, protein, hexosamine, phosphorus and uronic acid. However, the major component in C. albicans matrix was glucose (32%), whereas in C. tropicalis matrix it was hexosamine (27%). Biofilms of C. albicans were more easily detached from plastic surfaces by treatment with the enzyme lyticase ([beta]-1,3-glucanase) than were those of C. tropicalis. Biofilms of C. albicans were also partially detached by treatment with proteinase K, chitinase, DNase I, or [beta]-N-acetylglucosaminidase, whereas C. tropicalis biofilms were only affected by lipase type VII or chitinase. To investigate a possible role for the matrix in biofilm resistance to antifungal agents, biofilms of C. albicans were grown under conditions of continuous flow in a modified Robbins device (MRD). These biofilms produced more matrix material than those grown statically, and were significantly more resistant to amphotericin B. Biofilms of C. tropicalis synthesized large amounts of matrix material even when grown statically, and such biofilms were completely resistant to both amphotericin B and fluconazole. Mixed-species biofilms of C. albicans and a slime-producing strain of Staphylococcus epidermidis (RP62A), when grown statically or in the MRD, were also completely resistant to amphotericin B and fluconazole. Mixed-species biofilms of C. albicans and a slime-negative mutant of S. epidermidis (M7), on the other hand, were completely drug resistant only when grown under flow conditions. These results demonstrate that the matrix can make a significant contribution to drug resistance in Candida biofilms, especially under conditions similar to those found in catheter infections in vivo, and that the composition of the matrix material is an important determinant in resistance.

AB Electrophoretic karyotype and restriction endonuclease analysis of genomic DNA were used to type 9 isolates of C. albicans from the oral cavities of 2 AIDS patients (husband and wife, aged 38 and 34 yr) from Texas, USA, who had infections that had become resistant to fluconazole treatment (400 mg/d). The in vitro susceptibilities of sequential isolates to fluconazole, itraconazole and investigational drug D0870 were also evaluated. DNA analysis showed that the isolates responsible for fluconazole-resistant episodes of oropharyngeal candidosis in the 2 patients were genetically related. In vitro susceptibility to fluconazole correlated well with clinical outcome. Although the min. inhibitory concn of itraconazole and D0870 for fluconazole-resistant isolates were higher than those for fluconazole-susceptible isolates. Both

itraconazole and D0870 showed good in vitro activity against the isolates tested.

AN 1994-007528 [01] WPIDS
AB WO 1993025670 A1 UPAB: 20060108
Process (I) comprises separating deamidated and non-deamidated human DNase I from a mixture.
Also claimed are: (1) purified deamidated human DNase; (2) purified non-deamidated human DNase; (3) a pharmaceutical compsn. consisting of the deamidated human DNase and opt. a pharmaceutically acceptable excipient; (4) a pharmaceutical compsn. consisting on non-deamidated human DNase and opt. a pharmaceutically acceptable excipient; (5) a pharmaceutical compsn. comprising non-deamidated human DNase in a plastic vial; and (6) storage of human DNase by preparing a compsn. comprising non-deamidated human DNase in an aqueous solution having pH 4.5 - 6.8 and storing the compsn. for greater than 3 weeks.
Separation process requires a tentacle cation exchange resin, an immobilised heparin resin and an immobilised non-hydrolysable DNA analogue resin.
USE/ADVANTAGE - Deamidated human DNase or non-deamidated human DNase may be used for treatment of patients having an accumulation of viscous, DNA-containing material. Admin. of purified DNases pref. is via direct inhalation into the lungs. Non-deamidated human DNase may be admin. directly into the airway passages for the treatment of patients having pulmonary diseases e.g. chronic bronchitis, cystic fibrosis or emphysema. The DNases are employed for enzymatic alteration of the viscoelasticity of mucous, for treatment of patients with abnormal viscous, purulent secretions e.g. with infectious pneumonia, asthma, tuberculosis and fungal infections. - In an example, purified deamidated human DNase and purified non-deamidated human DNase for use in this study were prepared by TCX chromatography. DNase enzymatic activity, synthetic double stranded DNA, 25 base pairs in length, was labelled with dinitrophenol (DNP) on one end and with biotin on the other end. Hydrolysis of the substrate by DNase was detected by capture of the reaction prods. on microtiter plate wells coated with antibody to DNP and by quantitation of the intact probe with streptavidin-horseradish peroxidase. Specific activity of stability samples was correlated (r power(2) = 0.613; n=5) with the extent of DNase deamidation (range 27% - 93%). Extrapolation of the least squares linear equation provided an estimate that the specific activity of deamidated human DNase was approx. 77% lower than that of non-deamidated human DNase.

Member(0002)
ABEQ US 5279823 A UPAB 20060108
Deamidated and non-deamidated human DNases have been prepd. by recombinant DNA methods and sepd. and purified by chromatography with a heparin or non-hydrolysable DNA analogue bonded to a resin or other support medium as adsorbent. These enzymes are phosphordiesterases that cleave polydeoxyribonucleic acids. Pharmaceutical compsns. contg. deamidated or

non-deamidated DNase and the usual carriers and additives reduce the viscoelasticity of pulmonary secretions.

USE/ADVANTAGE - The prods. are therapeutics for chronic bronchitis, cystic fibrosis, emphysema, etc. The recombinant enzymes are free from contamination with proteases and other proteins.

Admin. of purified DNases pref. is via direct inhalation into the lungs. Non-deamidated human DNase may be admin. directly into the airway passages for the treatment of patients having pulmonary diseases e.g. chronic bronchitis, cystic fibrosis or emphysema. The DNases are employed for enzymatic alteration of the viscoelasticity of mucous, for treatment of patients with abnormal viscous, purulent secretions e.g. with infectious pneumonia, asthma, tuberculosis and fungal infections. - In an example, purified deamidated human DNase and purified non-deamidated human DNase for use in this study were prepd.. . .
